

API for send SMS

Request

URL	Method	Header Content Type
https://smsplus.az/api/sms/send	HTTP POST	application/json

Required parameters

Parameter name	Description	Type
Bearer Token	You can get it in the customer personal information	Authorization Bearer Token in Header
sender_name	From the list of approved sender names	Json Data String in Body
message_template_id	From the list of approved message templates	Json Data Integer in Body
mobile_numbers	Mobile numbers must be sent in an array	Json Data Array in Body

If there are parameters in the template, you should additionally send the values of the parameters corresponding to the number of mobile numbers. For each mobile number, the parameter's value will be replaced according to the parameter's structure in the message.

Additional parameters if required

Parameter name	Description	Type
first_parameters	If there is a first parameter in the message template, as many values of the parameter as the number of mobile numbers in the array must be sent.	Array
second_parameters	If the message template contains a first and a second parameter, the values of the first and second parameter, equal to the number of mobile numbers in the array, must be sent.	Array
third_parameters	If the message template has a first, second and third parameter, then the values of the first, second and third parameter, equal to the number of mobile numbers in the array, must be sent.	Array

Example of responses

```
{
  "success": true,
  "code": "100",
  "message": "Messages sent successfully"
}
```

```
{
  "success": false,
  "code": "101",
  "message": "The customer token was not found."
}
```

Responses

Success	Code	Message	Type
True	100	Messages sent successfully.	Json
False	101	The customer`s token was not found.	Json
False	102	The customer`s e-mail address has not been verified.	Json
False	103	The customer`s mobile number has not been verified.	Json
False	104	The customer`s passport photo has not been uploaded.	Json
False	105	The customer`s passport has not been approved.	Json
